

# PLANTING INFORMATION

## Plant-o-fix-System

### 1 Preparation

Take the roses out of the parcel. Remove the black lid and the photo label. Turn the pot and push it gently open using an edge. The brown, biodegradable inner pot will come out of the outer pot with the plant in it. Please do not pull or drag the plant out. Just check if the soil is humid, if not you may water a bit. If there are white roots coming out of the pot, do not destroy them!

### 2 Planting

The biodegradable pot shall be planted directly as it will decompose later in the soil. The graft union (knob between roots and branches) shall be 5 cm below ground level after the planting. Carefully fill the plant hole with soil and compress with your boots. Do not put fertilizer in the plant hole!

### 3 Mounding and Watering

Once set, water the plant sufficiently to ensure soil contact of the roots. Then mound with an additional 10 cm of soil (even more important in spring when the plant has no leaves). Only remove the mound when the new shoots are clearly visible. You may water additionally when the spring is very warm and dry. Too much watering is dangerous as the roots may not receive enough oxygen and may suffocate.
